15 August 2026 — Version 1

**Abstract**

Paper 45 found that a large ball's $\delta S$ tracks enclosed energy. This note measures the ratio.

One mass, 120 well-inside balls: med $\kappa = 0.968$, rel IQR 0.084. Two masses, 69 balls: 0.984 and 0.099. Relative shift 1.7%. The one-mass $\kappa$ predicts the two-mass $\delta S$ at Pearson 0.999.

Auditor, $N = 10$: 0.972 vs 0.992 (2.1%), CONFIRMED.

A reusable Gauss first-law constant, to about two percent. Not $1/4G$. Not $G_{\mu\nu} = 8\pi G T_{\mu\nu}$. Not de Sitter.

**Admission.** *I stopped punching kernels and asked for a number. I got one. I did not call it Newton's $G$.*
