

The Complement Is Not a Cosmological Horizon

Abstract

Metric SdS has $TdS + dM = 0$. This note asks the lattice complement of an enclosing ball.

The Fermi sea is pure: $S_0(B) = S_0(B^c)$. The packet puts $\delta S(B) = +0.196$ and $S_{\text{global}} = 0.196$. The new entropy is in the ball. $\delta S(B^c)$ is 10^{-5} or smaller, plus at $R = 3$, minus at $R = 4, 5$.

That is not a cosmological first law. Auditor $N = 10$: the same 10^{-5} minus. The magnitude is the result, not the sign of the dust.

I did not call a 10^{-5} remainder $TdS + dM = 0$.

Admission. *I asked the complement for the cosmological minus. The entropy stayed in the ball. I did not invent a horizon.*
