

Area Correlates. Clausius Does Not. This Is Not Gravity.

Abstract

A first law against energy is not Einstein. Gravity needs $\delta S = \eta \delta A$ with one η . At fixed hops, $\delta A \equiv 0$, so Papers 37–38 cannot be gravity.

This note rescales hops by a conformal bump Φ . $N = 12$, 512 balls. The vacuum first law holds (Pearson $1 - 8 \times 10^{-9}$). δS tracks hop-length area (Pearson 0.918). The ratio $\delta S/\delta A$ is not constant (relative IQR 3.17). Energy still predicts δS better than area.

Auditor, $N = 10$: area CONFIRMED, η REFUTED.

Not $1/4G$. Not $G_{\mu\nu} = 8\pi GT_{\mu\nu}$. Not de Sitter. Not a `MODELS.md` cell.

1 What this is

Jacobson’s Clausius argument, as a lattice measurement, with an independent geometric area. The correlation is real. The constant is not. Inherited Newton (task M9.2) is a different claim and has not been run.

Admission. *I asked for gravity and scored the gate that can give it. It failed. I did not write Einstein from a Pearson of 0.92.*
