Abstract

Papers 46–59 used $\alpha = 0.02$. There $S_{\text{global}} = 2h(\alpha)$ equals δS of an enclosing ball, and $\kappa = \delta S/P_{\text{flat}}$ looked like one number.

Scan $\alpha \in \{0.005, 0.01, 0.02, 0.04, 0.08\}$. κ falls $1.34 \rightarrow 0.75$ (rel range 0.57). It tracks $2h(\alpha)/(\alpha\Delta E)$ at Pearson 0.999998. Auditor: $1.26 \rightarrow 0.85$, C_{lin} REFUTED.

At fixed α , $\delta S \propto \sum \delta e$ still holds and the force-law papers still used $M = P_{\text{flat}}$. Across α , κ is not a coupling. The reusable mass is $\sum \delta e$.

Admission. *I never scanned α . The number I liked was $2h(\alpha)/(\alpha\Delta E)$ at $\alpha = 0.02$. I did not hide the run.*
