Abstract

Paper 51 asked for a cosmological constant and got a lumpy packet. This note uses the two unique flat eigenstates of the periodic hop: $k = 0$ and (π, π, π) . Occupation transfer then has $\delta e = 12\alpha/V$ to 10^{-12} .

$N = 12$. δS tracks enclosed energy at Pearson 0.999 and grows by a factor 21. P/V is constant; P/A is not. Inherited Poisson of that uniform density: $a_r < 0$, log-log slope 1.029. Not $1/r^2$.

Auditor, $N = 10$: uniformity CONFIRMED. Linear a CONFIRMED. Volume law REFUTED on wrapping balls that are most of the torus.

A valid fermion state sources Newtonian Λ . I did not derive Poisson, and I did not write a de Sitter dual.

Admission. *I used the two flat modes. The energy was flat. The force was linear. I did not call that de Sitter.*
