Abstract

A compact packet is a star: δS grows by 13% from $R = 2$ to $R = 5$ and then sits. A wide packet ($\sigma = 8$) grows by a factor 16. Both track enclosed energy (Pearson 0.999).

Nested volume and area are collinear. That is not a volume-versus-area theorem.

The wide δe is not a uniform fluid (std/mean = 0.35). Inherited Poisson does not give $a \propto r$. Auditor CONFIRMED the first law and REFUTED linear a .

The first law can tell a star from an extended source without Poisson. It did not give de Sitter.

Admission. *I asked for a cosmological constant. I got a growing ball. I did not call that Λ .*
