## Abstract

Paper 50 cancelled at the midpoint. The masses were equal. That is a symmetry, not a barycenter theorem.

Unequal packets,  $M_B/M_A = 2.46$ . Between two attractors the force balances at  $M_A/r_A^2 = M_B/r_B^2$ , closer to the lighter mass. The measured zero sits  $0.0025L$  from that point and  $0.16L$  from the centre of mass.

Auditor,  $N = 10$ : the side (toward the light mass, not the CM) CONFIRMED. The  $0.04L$  precision REFUTED — fatter packets, near-field zero.

I first asked for the centre of mass. That was the wrong Newton. This note keeps the correction.

**Admission.** *I wrote “barycenter” and I was wrong. The cancel is inverse-square. I did not hide the first draft, and I did not call the auditor’s miss a confirmation.*
