

Proper Area Does Not Save Clausius

Abstract

Paper 39 summed $1/|t|$ on the cut: a length. Clausius wants an area. Dual-face $1/t^2$ and weak-field $1 - \varepsilon\Phi$ differ from that length by a constant at linear order. Relative IQR of $\delta S/\delta A$ is therefore the same number.

$N = 12$, 512 balls. All three measures: Pearson $\delta S - \delta A \simeq 0.918$, rel IQR(η) $\simeq 3.17$. C_η FAIL. Energy still predicts δS better than area.

Auditor, $N = 10$: area CONFIRMED, η REFUTED.

The dimension of the geometric observable was not the obstruction. Not $1/4G$. Not Einstein. Not de Sitter.

Admission. *I ran the correction that could have turned Paper 39 into gravity. It is linearly the same test. I did not write Einstein.*
