

When Both Masses Sit Inside, δS Tracks Enclosed Energy, Not CHM

Abstract

Paper 44 could not score Gauss versus the CHM boost: only eleven $R = 2$ balls contained both masses. This note uses $R = 3$. Sixty-nine balls contain both.

δS tracks P_{flat} at Pearson 0.999, residual 0.053. CHM: 0.955 and 0.298. The boost weight varies ten times more than enclosed energy, and δS follows the small variation.

Auditor, 47 both-inside balls: C2b REFUTED.

Paper 37's CHM win mixed “in the ball” with “where in the ball.” Well inside, the first law is Gauss. Not $8\pi G$. Not Einstein. Not de Sitter.

Admission. *I gave the boost kernel the sample size it needed to win. It lost. I did not write linearized gravity.*
