Abstract

Hop-area cannot be Jacobson's δA at fixed hops (Paper 42). This note uses the correlator on the cut: $A_{\text{bond}} = \sum_{\partial B} |C_{ij}|$.

Occupation transfer, H fixed, 512 balls. δA_{bond} is nonzero. It is not S (purity tracks S at 0.99998; the bond area does not). It tracks P_{CHM} at $\rho = -0.925$. $C_{\text{indep}P}$ FAIL. $\eta = \delta S / \delta A_{\text{bond}}$ has rel IQR 0.87. C_η FAIL.

Auditor, $N = 10$: independence QUALIFIED ($\rho = -0.818$), η REFUTED.

The last obvious geometric object at fixed H is the energy first law on the cut. Not $8\pi G$. Not Einstein.

Admission. *I looked for a geometric δA that matter can source without moving the hops. I found a cut observable. I did not call an energy proxy a graviton.*
