Abstract

Paper 37 gave CHM the modular kernel. Paper 45 gave enclosed energy the well-inside first law. This note scores both, plus $\text{Tr}(K_{\text{vac}}\Delta C)$, as predictors of finite δS on 216 balls.

$\alpha = 0.005, 0.02, 0.08$. P_{flat} wins every time (0.991, 0.996, 0.999). CHM and T_K fall as α grows. Well-inside: the same winner. Auditor $N = 10$: P_{flat} at both α . No flip.

Finite δS tracks $\sum \delta e$. That is the same object Paper 61 uses as mass. The CHM win is about K , not about this δS .

Admission. *I put the three predictors on the same balls. Energy won. I did not flip the winner to save Paper 37.*
