Abstract

If one put $\rho = e_i(C_0) < 0$ into Gauss, a would point out. That is not what the first law does.

$N = 12$, compact packet. On a ball of radius 5, vacuum energy is 2762 times the packet and opposite in sign. δS tracks $\sum \delta e$ at Pearson 0.99999, and tracks raw $\sum e$ at -0.641 . $M_{\text{FL}} = \delta S / \kappa$ is the excess, not the sea.

Auditor, $N = 10$: excess 0.9999, raw -0.817 , scale 973. CONFIRMED.

The Fermi sea is not repulsive Newton gravity. The instrument subtracts it.

Admission. *I computed the outward diagnostic. I did not call it gravity. The first law never saw that mass.*
