Abstract

The first-law κ of Papers 46–52 was measured on a massless cube hop. The diamond waist is a geodesic ball of a 3 + 1D staggered fermion. This note turns the mass on.

$N = 12$. Occupation transfer at fixed H . $\kappa(m = 0) = 1.047$. $\kappa(m = 0.25) = 1.046$ (0.14%). $\kappa(m = 0.50) = 1.041$ (0.60%). The packet is still a star. $R = 3$ and $R = 4$ agree to 0.03%.

Auditor, $N = 10$: 0.975 vs 0.977 (0.21%), CONFIRMED.

Not $a \rightarrow 0$. Not $8\pi G$. Not de Sitter. The number survives the 3 + 1D mass term.

Admission. *I put the diamond mass on. κ barely moved. I did not call that a continuum theorem.*
