Abstract

Paper 66: the $T = 0$ transfer is dust. This note heats the periodic Fermi gas at $\mu = 0$. Same hop virial. The source is the excess over $T = 0$,

$$r(T) = (P(T) - P(0)) / (E(T) - E(0)).$$

Not $p = -E/V$.

$N = 12$. r runs $-58, -5.6, -0.96, -0.16, +0.02, +0.07$ as T goes $0.1 \rightarrow 4$. The pre-registered $|r + 1| < 0.25$ trips at $T = 0.5$. The ratio is not constant. Low T is $\varepsilon \approx 0$ modes with large virial. Auditor $N = 10$: $r = +0.72, +0.23, +0.17$. C_lambda refuted.

Not de Sitter. Gravity remains $\sum \delta e$ plus inherited Gauss.

Admission. *I pre-registered any T near -1 as Λ . $N = 12$ at $T = 0.5$ tripped it. The scan and the auditor both refuse a constant. I do not cash it.*
