Abstract

Papers 48–54 solved a Dirichlet box to get **a**. This note does not. Spherical Gauss and the first-law mass $M = \delta S/\kappa$ give

$$a(R) = -M(R)/R^2.$$

A compact packet: M plateaus, slope of $|a|$ vs R is -1.997 on $R = 3, 4, 5$. A periodic band-edge sea: M grows with volume, slope $+1.266$.

Auditor, $N = 10$: -1.889 and $+1.237$, CONFIRMED.

I kept Gauss. I dropped the box. I did not derive Einstein, and I did not write a de Sitter dual.

Admission. *I stopped solving Poisson. The first-law mass and Gauss already knew the two laws. I did not call that a derivation of $G_{\mu\nu} = 8\pi GT_{\mu\nu}$.*
